

Connectivity Engine

100% Open Source based cloud integration services!

What ?
A cloud integration solution

For whom?
Organisations that needs to integrate with partners, suppliers and/or customers

Why?
To lower your total cost of ownership

If you look in to your organisations integration needs with partners, suppliers or customers you will be interested to:

- Avoid investments in infrastructure, operations and knowledge
- Lower your TCO total cost of ownership
- Choose from flexible delivery options
- Avoid vendor lock-in and expensive license costs

Out Of The Box Connectors

Redpill Linpros Connectivity Engine platform lets you get started immediately in the Cloud with over 180+ connectors to popular applications and services for extensive connectivity or build your own custom components for specific endpoint connectivity requirements. Find out about all available connectors at: www.redpill-linpro.com/connectivity-engine-connectors

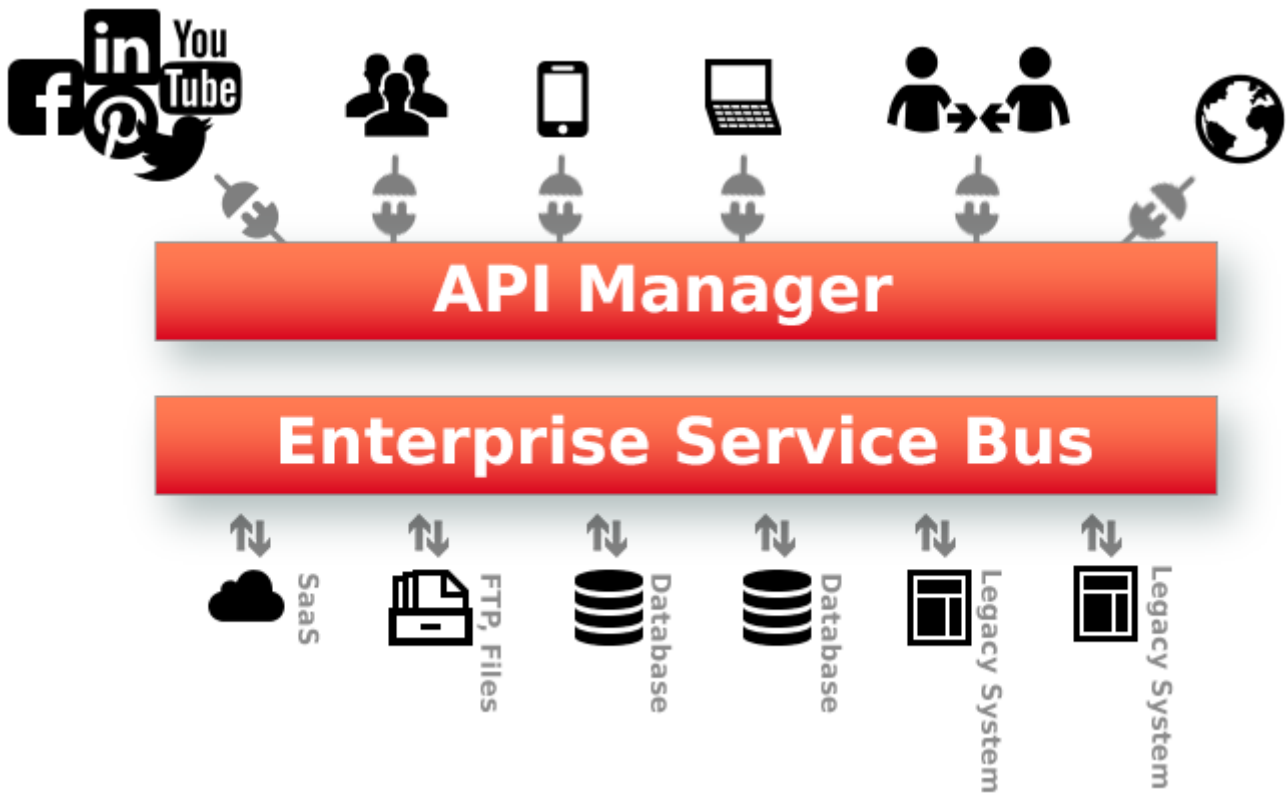

Management and Monitoring dashboard

Redpill Linpros cloud integration solution offers you through the Management and monitoring dashboard to

- Visually manage the life-cycle of all integration applications and their routes, so you can restart / stop / pause / resume, change configuration etc.
- List all routes in each integration and their runtime statistics
- Perform real time metrics with graphical representation of the running routes
- Live profiling, tracing and debugging of running routes in real time
- View the business KPI's and pro-actively respond for efficient operations.
- Browse and send, and redirect messages to queue- and other connector endpoints
...and more...

Standards based development environment

Design, develop, test and deploy integration solutions faster , using a palette of supported Enterprise Integration Patterns with an easy-to-use standards based develop environment.

Flexible delivery options gives you full control

In line with our mission "With open minds and technology we support company growth and business execution speed" we provide many different delivery and management options for our Connectivity Engine Integration services. The solution is based on a completely open source product stack that gives us and you total freedom and flexibility of choosing how the services should be delivered and managed initially and changed over time in line with your organisation strategies.

Full integration

Meaning that we take full responsibility for management of the integration and provides all necessary resources to manage and support your integration, of course you get full insight to whats happening with access to your integration services with the Management and monitoring tools. This option is a good starting point if you are in a hurry to get your integration up and running as fast as possible. You will not get locked in in the "Full Integration" but can at any time transfer to any of the other delivery services described below.

Semi integration

Sharing the responsibility for the management of the connectivity engine with you, based on your specific needs and preference. We will work tight with your team and sharing our deep knowledge with you to ensure that the joint management run smoothly and effectively. This could also be an intermediate step between "Full Integration Brokerage" and "Integration Platform as a service" brokerage if this is the path you want to follow.

Integration Platform as a service

If your organization have the time, resources and knowledge on how to manage your integrations the "Integration Platform as a Service" offers you a quick start with all infrastructure in place. This will help you get up and running your integrations faster and save you investments in infrastructure and resources to manage the infrastructure.

Hybrid architecture with private on premises cloud

Need to have a hybrid architecture with some integrations managed in a private cloud on premises? No problem, we could help you set up your private cloud based on our 100% open source based integration platform.

Special requirements welcome

Do you have requirements not covered in the scenarios above, don't hesitate to contact us for further discussions. Our mission is "With open minds and open technology we support company growth and business execution speed" so you are welcome to challenge us with your specific needs!

Redpill Linpro IaaS security Information

Redpill Linpro takes security seriously and we know that our customers do too, which is why we use Red Hat Enterprise Linux technology, with its existing security features, as the basis for the platform.

Co-Location Security

The platform runs in Redpill Linpros top of the line tier3 data center located in Hammarö, Sweden. Only personnel from Redpill Linpro have physical access to the servers and the network infrastructure. We have a long history of managing systems with excellent track record both when it comes to security and reliability.

CE Security

Redpill Linpro has a long history of managing Linux/Unix based systems and among us we have some of the sharpest minds when it comes to managing systems and industry-leading responsiveness to security vulnerabilities.

Our systems are hardened with technologies like:

- Extensive SELinux protection, hardening and isolation
- Process, network, and storage separation
- Statefull and stateless inspection firewall
- Proactive monitoring of capacity limits (CPU, disk, memory, etc.)
- Intrusion detection (files, ports, back doors, etc.)
- Port monitoring
- Pam namespace
- Security compliance frameworks
- RPM verification and vulnerabilities updated
- Remote logging
- Encrypted communications (SSH, SSL, etc.)

Network Transport

Private data and logins exchanged with the platform is transmitted over SSL (our web interface utilizes HTTP Strict Transport Security). Pushing and pulling of private data is done over SSH authentication with keys, not passwords, to help prevent brute force cracking.

Maintaining Security

Redpill Linpro are concerned and active about security, the platform is built on a well tested and proven open source base and is constantly improved by security teams both from Redpill Linpro and the community that helps identify and prevent new exploits.
